## How to Manually Change Between Day & Night Mode

If your Private CloudPBX phone system is configured to handle incoming calls differently between business and non-business hours, it will automatically switch between day and night mode as programmed to. You can override this but using \* codes. These codes can be used from any extension in your CloudPBX:

• Force into night mode: \*642

• Force into day mode: \*641

• Set back to automatic mode: \*64

Once the system is forced into night or day mode, it will stay in that mode until you dial \*64 to put it back into automatic mode.

Note: this override option needs to be enabled first. If it doesn't work for you, please contact <a href="mailto:support@naturalnetworks.com">support@naturalnetworks.com</a> to request this.
